(Methenolone Enanthate) Methenolone is an anabolic androgenic steroid that was first released in 1962 by Squibb under the trade name Nibal (oral) and Nibal Depot (injectable). This was a very short-lived product on the U.S. market and by the mid-1960's the German pharmaceutical powerhouse Schering would own all rights to the Methenolone hormone. Metenolone enanthate, or methenolone enanthate, sold under the brand names Primobolan Depot and Nibal Injection, is an androgen and anabolic steroid (AAS) medication which is used mainly in the treatment of anemia due to bone marrow failure. It is given by injection into muscle. #bodybuilding #motivation #gym #bodybuildingmotivation #tnt #supplements #whey #lockedandloaded #anabolic #gymjunkie #hardcoreapproved #bodybuildingnation

Methenolone Enanthate injection is available in 100mg/ml ampoule and has a duration of action (due to the gradual transition of the drug from the muscles in the blood), at approximately 2 weeks. Methenolone has no estrogenic side effects, and its effects on cholesterol levels are minimal. Primobolan® Depot is the injectable version of the steroid methenolone. This of course is the same constituent in Primobolan© Orals (methenolone acetate), both produced by the firm Schering. In this preparation, an enanthate ester is added to the steroid, which causes a slow and gradual release from the site of injection.

In a clinical study, the group on the Optimal Weight 5 & 1 Plan® lost 10x more weight
Average weight loss on the Optimal Weight 5 & 1 Plan® is 12 p

The injectable format (Methenolone Enanthate) in particular is simply Methenolone with the Enanthate ester bound to the Methenolone chemical structure. Specifically, 'Enanthate' is Enanthoic acid (also known as carboxylic acid), but once bound to Methenolone it is properly referred to in chemistry as an ester bond (or ester linkage).

To our family, I appreciate all of your efforts from planning, cooking, event coverage & designing for our special occasion and I will forever thank God for having you as my family. Primobolan Injection employs methenolone with a carboxylic acid ester (enanthoic acid) connected to the 17-beta hydroxyl group. Esterified steroids are less polar than free steroids, and are imbibed slower from the field of shot. At one time in the bloodstream, the ester is moved out to yield free (active) methenolone. Food is fuel to me yes I enjoy the greater things in life but often times I feel like im depriving myself of the joys life offers. So I decided to take it upon myself and modified the way I eat and feed the beast within. [get more information](#)
