# 5 BENEFITS OF DHEA

## Improves Sexual Health

An intravaginal DHEA-based drug called prasterone is available by prescription for menopausal women, which can improve vaginal dryness and discomfort. It also improves lubrication, desire and orgasm, allowing women to experience better, less painful sex. However, it's not without risk because prasterone, like any estrogen-related hormone therapy, may increase the risk of breast cancer.

## May Offset Some Aspects of the Aging Process

Part of the natural process of aging is the slowed production of testosterone, estrogen and DHEA (X). Research suggests that DHEA supplementation may increase bone mineral density and muscle mass in older women, but the evidence is unclear. Moreover, the connection between DHEA supplementation and breast cancer risks to postmenopausal women is also unclear, so it may not be a prescribing doctor's first recommended therapy.

## May Improve Mood and Sense of Well-Being

People have reported an improvement in their cognitive function, mood and well-being after taking DHEA for a period longer than a week. However, the science doesn't fully back up these claims.

A seven-day, double blind study was conducted on 24 healthy young men who took a placebo or 150 mg daily of DHEA. The study took place because lab rats in a similar trial showed an increase in cognition. With humans, though, researchers found a decrease in the hormone cortisol (a steroid hormone linked to stress) along with improved mood and memory function. While the findings were interesting, the trial was too short to produce conclusive results.

## May Reduce Suffering for Patients with Chronic Illnesses

In recent years, DHEA has been studied in relation to several chronic diseases like adrenal hormone deficiency, lupus and chronic fatigue syndrome (CFS).

For instance, in the case of CFS, scientists have pointed to DHEA deficiency as an important area of focus. One study found that 89 percent of participants had "suboptimal" production! More research is ongoing as to how DHEA supplementation may help CFS patients.

## Fertility

In recent years, DHEA has been increasingly used by women trying to conceive through in vitro fertilization (IVF). Under the strict supervision of doctors, women with diminished ovarian reserve (DOR) have been given DHEA to attempt to increase the quality and quantity of eggs produced in an IVF cycle. Findings report that women may produce more eggs and embryos as a result due to increases in androgen levels. Eggs in an androgen-boosted environment may develop into robust embryos whose chances of uterine implantation may be higher.
