150 mg Of Testosterone Per Week | Results, Side Effects

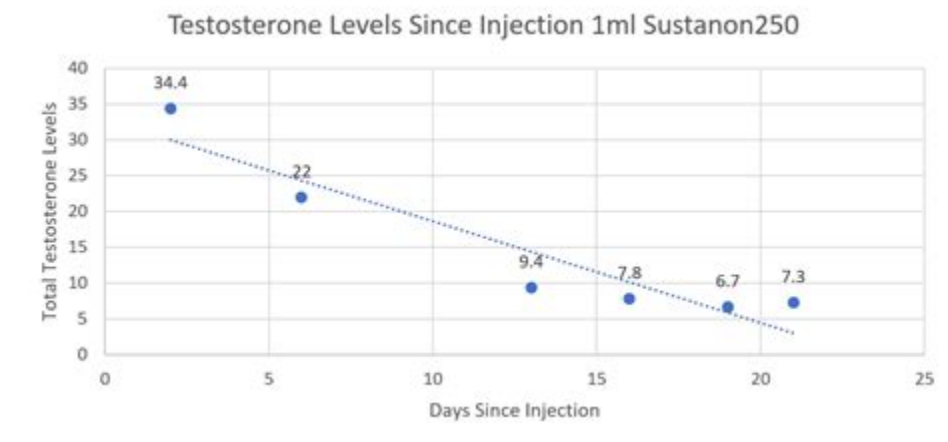

Generally, a starting dosage of 50 to 100 milligrams of testosterone per week is recommended, with adjustments made as necessary based on lab tests and symptoms. Typical TRT Frequency The frequency of TRT injections also varies, but most patients receive injections once or twice a week.

Does It Take Long to See Results from Testosterone Replacement Therapy?

Testosterone cypionate (cyclopentylpropionate) is another separate (mono) ether of testosterone, which is actively used in strength sports. Unlike enanthate and propionate, cypionate does not have a classical half-life. It ranges from four to eight days. Therefore, not everyone comes to choose the optimal scheme for using this ether.

Aims: To study the effect and time profile of different doses of testosterone enanthate on the blood lipid profile and gonadotropins.

Experimental design: Twenty-five healthy male volunteers aged 27–43 years were given 500 mg, 250 mg, and 125 mg of testosterone enanthate as single intramuscular doses of Testoviron® Depot. Luteinizing hormone (LH), follicle-stimulating hormone (FSH), blood lipid profile (total cholesterol, plasma [p-] low-density lipoprotein, p-high-density lipoprotein [HDL], p-apolipoprotein A1 [ApoA1], p-apolipoprotein B, p-triglycerides, p-lipoprotein(a), serum [s-] testosterone, and 25-hydroxyvitamin D3) were analyzed prior to, and 4 and 14 days after dosing. Testosterone and epitestosterone in urine (testosterone/epitestosterone ratio) were analyzed prior to each dose after a washout period of 6–8 weeks.

Results and discussion: All doses investigated suppressed the LH and FSH concentrations in serum. LH remained suppressed 6 weeks after the 500 mg dose. These results indicate that testosterone has a more profound endocrine effect on the hypothalamic–pituitary–gonadal axis than was previously thought. There was no alteration in 25-hydroxyvitamin D3 levels after testosterone administration compared to baseline levels. The 250 and 500 mg doses induced decreased concentrations of ApoA1 and HDL, whereas the lowest dose (125 mg) did not have any effect on the lipid profile.

Conclusion: The single doses of testosterone produced a dose-dependent increase in serum testosterone concentrations together with suppression of s-LH and s-FSH. Alterations in ApoA1 and HDL were observed after the two highest single doses. It is possible that long-time abuse of anabolic androgenic steroids will lead to alteration in vitamin D status. Knowledge and understanding of the side effects of anabolic androgenic steroids are important to the treatment and care of abusers of testosterone.

Keywords: anabolic androgenic steroids, testosterone, gonadotropins, vitamin D, blood lipids, abuse

Introduction

"Anabolic androgenic steroids" (AASs) are chemical modifications of testosterone.¹ Testosterone is one of the most frequently abused AASs in society, along with nandrolone and stanozolol,^{2–4} and is considered a widespread public-health problem.⁵ The major purpose of AAS abuse is to improve the user's esthetic appearance and strength by the anabolic effects.⁶ The abuse of these substances is associated with psychiatric side effects such as affective symptoms, loss of impulse control, aggression, and suicide.⁷ Somatic adverse reactions of AAS abuse include disturbances in the lipid profile, cardiovascular effects, dermal manifestations, and endocrine adverse reactions.⁸ Decreased secretion of the pituitary luteinizing hormone (LH) and follicle-stimulating

All formulations are also available as generic. Each unit-dose tube or packet contains 50 mg of testosterone/5 g. The multi-dose metered pump provides 12.5 mg of testosterone per actuation. It is recommended to start Vogelxo® at a dose of 50 mg applied once daily to the shoulders or upper arms. Dose adjustments are based on serum testosterone .

Pharmacology of testosterone replacement therapy preparations

TABLE 2
FDA-approved testosterone formulations²

Formulation	Trade names	Dosing, route, and administration	Benefits	Potential adverse effects or drawbacks
Testosterone cypionate, testosterone enanthate		75-100 mg IM every week or 150-200 mg IM every 2 weeks	Short-acting preparation that allows for drug withdrawal in the event of adverse effects	Fluctuation of testosterone levels
Testosterone undecanoate	Aveed	750 mg IM followed in 4 weeks by another 750 mg IM, then 750 mg every 10 weeks thereafter	Steady-state testosterone levels without fluctuation	Long-acting formulation; does not allow for rapid discontinuation of therapy if adverse effects develop
Transdermal and transmucosal testosterone	Androderm (patch)	A single, 2-6-mg patch daily	Most closely mirrors physiologic testosterone levels	May cause skin irritation; risk of transfer to partner or children
	Axiron (axillary)	30-120 mg daily		
	AndroGel, Testim, Vogelxo (gel)	50-100 mg daily applied to shoulders, arms, or abdomen		
	Fortesta (gel)	10-70 mg daily applied to thighs		
	Natesto (intranasal)	11 mg 3 times daily		
	Striant (buccal)	30 mg every 12 hours		
Oral testosterone	Androxy (fluoxymesterone)	5-20 mg daily in a single or divided doses	Daily oral dosing	Difficult to obtain normal physiologic levels; risk of hepatotoxicity
	Android, Methitest, Testred (methyltestosterone)	10-50 mg daily		
Subdermal testosterone pellets	Testopel	150-450 mg implanted subcutaneously every 3-6 months	Long duration of action	Infection at implantation site; explantation

IM, intramuscular.
