Best SARMs for Women for Cutting, Bulking, Mass & Strength

The best SARMs stacks for women involve LGD-4033 and GW-501516. This powerful stack helps to improve lean muscle mass while also shredding fat. It's, therefore, an excellent stack for most advanced bodybuilders. I wouldn't encourage any beginners to stack these SARMs though. A typical LGD-4033 and GW-501516 should run for six weeks taking .

Best SARMS for Beginners - SARM Stacks for Bodybuilders Starting Out .

The best SARMS stack for bulking and gaining muscle mass would ideally include a combination of RAD 140, LGD-4033, MK 677 and Ostarine (MK-2866). These are considered the 4 best SARMS to buy in .

6 Best SARMs For Weight Loss & Fat Burn - The Island Now

Cardarine is arguably the best SARM for women to use. Cardarine works by activating the PPAR delta pathway, which regulates the body's energy expenditure. By stimulating this pathway, Cardarine .

Adverse effects and potential benefits among selective androgen receptor modulators users: a cross-sectional survey

Iakov V. Efimenko^{1,2}, David Valancy¹, Justin M. Dubin¹ and Ranjith Ramasamy¹

Selective androgen receptor modulators (SARMs) are a class of androgen receptor ligands that bind androgen receptors and display tissue selective activation of androgenic signaling. SARMs have selective anabolic effects on muscle and bone, and were originally synthesized for treatment of muscle wasting conditions, osteoporosis, breast cancer. To date, no SARM has been clinically approved and little is known about the beneficial effects and other adverse effects on users. We examined the adverse effects and potential benefits of SARMs amongst users. We performed an internet survey assessing the demographics of users via a 32-question survey. Using reddit as a platform, we distributed the survey through various subreddits that included potential SARMs users. Out of the 520 responses, 343 participants admitted having used SARMs. Most were males (98.5%), between the ages of 18–29 (72.3%). More than 90% of users acquired SARMs via the internet and did not consult with a physician. More than half of SARMs users experienced side effects including mood swings, decreased testicular size, and acne. More than 90% of men reported increased muscle mass and were satisfied with their SARMs usage. Despite having seemingly positive effects, more than 50% of SARMs users report significant adverse effects. Chi square was the main method of statistical analysis. Future studies should focus on comprehensive reproductive evaluation of men using SARMs.

INTRODUCTION

Selective androgen receptor modulators (SARMs) are a class of androgen receptor ligands that bind androgen receptors and display tissue-selective activation of androgenic signaling. The initial efforts to develop steroidal SARMs, based on modifications of the testosterone molecule, date back to the 1940s [1]. In recent years, Ligand Pharmaceuticals were the first to develop a SARM with anabolic activity on skeletal muscle and some degree of tissue selectivity. Two decades since these early efforts, we have witnessed the emergence of a large number of nonsteroidal SARMs from virtually all major pharmaceutical companies but there has been little success in bringing an FDA approved product to market [2]. Furthermore, the success of SERMs such as clomiphene, which now plays an important role in treating both male and female infertility, has reignited interest in SARMs [3].

SARMs with selective anabolic effects on muscle and bone were originally synthesized for treatment of muscle wasting conditions, osteoporosis, breast cancer, and prostate cancer [4]. Such therapeutic compounds were designed to have similar effects to anabolic agents but with reduced androgenic properties. These properties, unfortunately, make SARMs highly attractive for doping in sporting events as well as for illegal bodybuilding use by adolescents and young adults. Prior to 2019, these novel therapeutic compounds were being sold legally over the counter in many supplement stores across United States, as well as various internet portals [5, 6]. Furthermore, concerns about the safety of these products were validated by a study in 2013 in which one of the commonly abused SARMs, ligandrol, was shown to have a

dose-dependent suppression of total testosterone, SHBG, HDL, TG, FSH, LH [7]. Despite being banned by the US Congress in 2019, SARMs continue to be sold on many internet portals, easily sourced as “research compounds not intended for human consumption” and are widely available to the public [8]. Although SARM usage in the treatment of cachexia, BPH, hypogonadism, breast cancer, and prostate cancer seems promising, no SARM to date has received full clinical approval [9].

While SARMs are known to modify androgen receptors, little is known about the effects they may have on the fertility or other adverse effects of its users; there is an urgent need for an investigation. Furthermore, to our knowledge, there has been no study assessing the demographics of people who recreationally use SARMs. Because of the wide availability of these compounds via various internet portals, we hypothesized that many younger individuals are able to get access to these powerful and potentially dangerous compounds. Therefore, we examined the adverse effects among SARMs users in a cross-sectional online survey using Reddit.

MATERIALS AND METHODS

We performed an internet-based survey assessing the demographics of SARMs users via 32 question online survey on Qualtrics. Qualtrics XM is a user experience management software program licensed under University of Miami, which allows users to create and distribute surveys. Reddit is a social news aggregation, web content rating, and discussion website, and it claims to be the “front-page of the internet”. As of February 2021, reddit analytics reported 430 million active users [10]. In our project we used
