The difference between these 2 versions of Primobolan is in the method of administration: Primobolan Depot (also known as Primobolan Enanthate) is the liquid (oily based solution) that should be administered in the form of injection, whilst the second oral Primobolan Acetate is coming in form of pills which should be administered orally by mouth. Primobolan Depot or Methenolone Enanthate is the injectable form of the steroid. Bioavailability is not an issue here, and this makes it more efficient and generally better. But then you'll have to deal with frequent injections and the possibility of infections and swellings at the site of injection. Dosage
