Dianabol is a C17-alpha alkylated anabolic steroid, and as a result, carries a hepatotoxic nature. The rate of hepatotoxicity can vary greatly from one C17-aa steroid to the next, and while Dbol is far from the most toxic, we can't call it mild either.

@rockanutrition

Dianabol Cycle and Dosage. The most common form of release of the drug is a tablet (although injections can also be found). The half-life of the active substance in the body is relatively short, so the daily dosage is best divided into two parts, taking morning and evening, which will help maintain a stable concentration of the drug in the blood.
