Test Enanthate Half-life - Medical Health Authority

There is considerable variation in the half-life of unbound testosterone, ranging from 10 to 100 minutes. Esters are attached to the testosterone molecule by a process called hydrolysis. Esters are essentially a class of organic compounds that react with water to produce alcohols and organic or inorganic acids.

What is Test Enanthate? Test Enanthate, or "Test E," is also an injectable form of testosterone, but with a slightly shorter ester attached to its molecular structure. This means that it has a shorter half-life than Test C, typically around 10 days. Test E is often used in TRT protocols and is also popular with bodybuilders looking to bulk up.

Each regimen was separated by at least 6 months, and the next one was not initiated until testosterone decreased to hypogonadal levels. Serum levels peaked at approximately one month and were sustained in the normal range for four to five months with either 600 mg dose and for 6 months with the 1,200 mg dose. The estimated half-life was 2. 5 months.

Testosterone enanthate is one of the most widely used intramuscular T esters. At a dose of 200-250 mg the optimal injection interval is 2-3-weeks but peak and through values are clearly above and below the normal range (Behre et al 2004). Testosterone propionate has a terminal half-life of only 19 hours.

Testosterone enanthate has an elimination half-life of 4. 5 days and a mean residence time of 8. 5 days when used as a depot intramuscular injection. [1] It requires frequent administration of approximately once per week, and large fluctuations in testosterone levels result with it, with levels initially being elevated and supraphysiological. [1]

What Is the Half-Life of Testosterone Enanthate - Nexel Medical

#1 Hey All, I'm wondering if anyone has any solid, scientific (or more accurate) information on the ACTUAL half-life of test enanthate. On most "steroid/juice/cycle" type sites you'll generally see a listing of steroid esters and half-lives. These almost always state the half-life of TE around 8-10 days,

with cypionate being a couple days longer.

Testosterone cypionate - Wikipedia

As such, testosterone cypionate and testosterone enanthate are considered to be "functionally interchangeable" as medications. For reference, testosterone enanthate has an elimination half-life of 4. 5 days and a mean residence time of 8. 5 days and requires frequent administration of approximately once per week. [19]

Testosterone depot injection in male hypogonadism: a critical appraisal

Clinic of Urology/Andrology, Segoberger Kliniken, Nordersoedt-Hamburg, Germany and Department of Urology, Gulf Medical College School of Medicine, Ajman-UAE 'Urology Division at the University of Witwaterstrand & Johannesburg Hospital, Johannesburg, South Africa Abstract: Testosterone compounds have been available for almost 70 years, but the pharmaceutical formulations have been less than ideal. Traditionally, injectable testoste esters have been used for treatment, but they generate supranormal testosterone levels shortly after the 2- to 3-weekly injection interval and then testosterone levels decline very rapidly, becoming subnormal in the days before the next injection. The rapid fluctuations in plasma testosterone are subjectively experienced as disagreeable. Testosterone undecanoate is a new injectable testosterone preparation with a considerably better pharmacokinetic profile. After 2 initial injections with a 6-week interval, the following intervals between two injections are almost always 12-weeks, amounting eventually to a total of 4 injections per year. Plasma testosterons levels with this preparation are nearly always in the range of normal men, so are its metabolic products estradiol and dihydrotestosterone. The "roller coaster" effects of traditional parenteral testosterone injections are not apparent. It reverses the effects of hypogonadism on bone and muscle and metabolic parameters and on sexual functions. Its safety profile is excellent due to the continuous normalcy of plasma testosterone levels. No polycythemia has been observed, and no adverse effects on lipid profiles. Prostate safety parameters are well within reference limits. There was no impairment of uroflow. Testosterone undecanoute is a valuable contribution to the treatment options of androgen deficiency.

Introduction to the various testosterone preparations for treatment of hypogonadal men

Soon after its chemical identification more than 70 years ago, the male hormone testosterone (T) became pharmaceutically available. But it took considerable time before convenient and safe preparations were developed. Three approaches have been used to make T therapeutically effective: (1) routes of administration, (2) esterification in the 17\(\beta\)-position, and (3) ebemical modification of the molecule, or a combination of approaches. In clinical practice, particularly in the perception of the patient, the route of administration is most relevant, and is used to categorize the preparations described here. Recent reviews of treatment modalities may be recommended (Gooren and Bunck 2004; Nieschlag 2006).

Free unesterified T is absorbed well from the gut but is effectively metabolized and inactivated in the liver before it reaches the target organs. Pharmacological changes of the T molecule in the 17α-position render the molecule orally effective. Alkylated derivatives of T including methyltestosterone and fluoxymesterone are administered orally or sublingually. They are metabolized by the liver, like natural T, but more slowly, and, like T, interact directly with androgen receptors. Clinical responses are variable and plasma levels cannot be determined accurately, because alkylated androgens are not recognized by most T assays. Prolonged use (especially the 17α- alkylated androgens)

I used to think you needed at least 500mg/wk too, not any more. If you have low T 150mg/wk will give you good gains. I would say someone with normal T levels would need 250wk min to make it worth shutting down your natural test production. I would suggest 300-500 for a first cycle, 10wks min, 12-14wks more favorable.
