## TRENBOLONE

### Popis:

z dostupných materiálov vyplýva, že sa jedná o prostriedok zneužívaný predovšetkým silovými atlétmi a kulturistami. Má údajne okrem vysokej androgénnej účinnosti aj veľmi vysoké anabolické pôsobenie. Na rozdiel od iných vysokoandrogénnych prostriedkov nearomatizuje, pretože účinná látka nekonvertuje na estrogény. I preto neexistujú feminizačné javy vyvolané zneužívaním tohto prostriedku. Zadržiavanie vody má taktiež veľmi nízke, čo ho predurčuje k tomu, aby bol zneužívaný predovšetkým v príprave na súťaže. Udávané je jeho efektívne spojenie s diétou chudobnou na kalórie, ale bohatou na bielkoviny. Výsledkom je vynikajúca potréninová regenerácia, tvrdá až brutálne hustá svalová hmota s vysokou žilnatosťou. Snáď samozrejmosťou je výrazný silový potenciál, ktorým disponuje dopingový hriešnik, zneužívajúci tento prostriedok.

O trenbolone sa tvrdí, že nepatrí k celoročne zneužívaným anabolicko-androgénnym steroidom. Doba použitia je obmedzená len na niekoľko málo týždňov vzhľadom na jeho toxicitu.

### Vedľajšie účinky:

Predstavuje enormnú záťaž pre obličky, v menšej miere i pre pečeň. Spomínajú sa prípady, kedy dopingoví konzumenti zneužívajúci tento prostriedok dlhší čas v závere doslova močili krv. Zvýšený príjem tekutín (3-5 litrov) pri zneužívaní trenbolone považujú mnohí za nutnosť. Akné a vypadávanie vlasov sa tu vraj vyskytuje iba zriedkavo.

### Zneužívané dávky:

z dostupných informácií vyplýva, že najčastejšie bývajú zneužívané dávky v rozsahu 76-228 mg na týždeň. Prirodzene, aj tu existujú kombinácie v závislosti na tom, v ktorom období sa tento prostriedok zneužíva. Pre nárast objemu sa zneužíva kombinácia s prostriedkami stanozolol, methandienone a oxymetholone. Zisk svalovej tvrdosti a hustoty zabezpečí údajne kombinácia s oxandrolone, ale aj s rastovým hormónom.
