

Is hgh safe for seniors?

What are the dangers of HGH?

HGH treatment might cause a number of side effects for healthy adults, including:

- Carpal tunnel syndrome.
- Increased insulin resistance.
- Type 2 diabetes.
- Swelling in the arms and legs (edema)
- Joint and muscle pain.
- For men, enlargement of breast tissue (gynecomastia)
- Increased risk of certain cancers.

What does HGH do to your heart?

It increased the myocardial mass and reduced the size of the left ventricular chamber, resulting in improvement of hemodynamics, myocardial energy metabolism and clinical status. These promising results open new perspectives for the use of GH in heart failure.

What age is best for growth hormone treatment?

GH injections are quick and almost pain-free, so children **ages 10 and up** may be able to and often prefer to give themselves their own injections. It is important that a parent supervises the injection to make sure the child gives the correct dosage each day. Parents should give the injections to younger children.

What happens when you stop taking HGH?

Growth hormone deficiency (GHD) in adults is associated with **increased adiposity**,1 adverse serum lipid profiles,2 and reduced exercise capacity. 3Lethargy, low mood and social isolation,4 reduced bone mineral density,5 and excess mortality, partly the result of increased cardiovascular deaths,6 have also been reported.

Does HGH shorten your life?

Other research has shown that people with low levels of HGH due to surgical or radiation damage to the pituitary gland that makes HGH have **increased risk of cardiovascular disease**, a factor that can shorten life span.

Does HGH damage your liver?

HGH prompts the liver and other organs to make IGF-1, which affects many tissues and organs in the body. Studies usually measure IGF-1 rather than growth hormone directly because IGF-1 levels remain more constant.

Are HGH injections safe?

Although **growth hormone injections are relatively safe and effective**, there are a few side effects. Fortunately, serious side effects are rare. Swelling, numbness, and joint and muscle aches and pains are the most common side effects.

Who qualifies HGH?

A diagnosis of GHD should still be considered if all of the following criteria are met: (1) height is shorter than 2.25 SDs below the normal mean for age or shorter than 2 SDs below the mid parental height percentile; (2) growth velocity (GV) is slower than the 25th percentile for bone age; (3) bone maturation is

How long does it take for HGH to work in adults?

Expected Results with Six Months of HGH Peptide Therapy

While patients will notice some significant increases changes in the body after the first month, the full-benefits are usually fully noticed after **three to six months** of therapy.

Is growth hormone bad for your kidneys?

There have now been many studies on the effects of growth hormone (GH) on renal function. Chronically elevated GH levels, such as occur in acromegaly, are associated with an increase in renal plasma flow (RPF), glomerular filtration rate (GFR) and kidney size.

Who should not take SeroVital?

If you or someone you know is **under the age of 18**, we cannot recommend taking the product, as it was tested only on and intended for use by healthy individuals over the age of 18.

Can you take HGH without testosterone?

First, it's important to point out that HGH has very little—if any—impact on testosterone levels, as this particular protein is not involved in the production of testosterone. In the most literal sense, **HGH is not an effective treatment for low testosterone**.
