Different steroids have different half-lives, and the longer the half-life, the longer it will take for the compound to exit your system Anadrol - 16 hours or less Andriol (testosterone undecanoate) - 8 hours or less Dianabol - 6 to 8 hours for oral; 60-72 hours for injectable Halotestin - 6 to 8 hours Anavar - 8 to 12 hours

Mixing Steroids and Cocaine: What Are the Risks?

There are two different types of naturally occurring steroids: anabolic and Anabolic steroids are derived from male hormones and help to build bone tissue, muscle tissue, and other tissues in the Catabolic steroids, or glucocorticoids, are produced as a response to stress, and they break down and metabolize substances in the

Steroids - Alcohol and Drug Foundation - ADF

Drugs of Abuse: ANABOLIC STEROIDS

A Library and Resource Center on Alcohol, Tobacco, Other Drugs, Mental Health and Wellness

What are steroids?

Anabolic steroids are synthetically produced variants of the naturally occurring male hormone testosterone that are abused in an attempt to promote muscle growth, enhance athletic or other physical performance, and improve physical appearance.

Testosterone, nandrolone, stanozolol, methandienone, and boldenone are some of the most frequently abused anabolic steroids.

What is their origin?

Most illicit steroids are smuggled into the U.S. from abroad. Steroids are also illegally diverted from legitimate sources (stolen or inappropriately prescribing). The Internet is the most widely used means of buying and selling anabolic steroids.

Steroids are also bought and sold at gyms, bodybuilding competitions, and schools from teammates, coaches, and trainers.

What are common street names?

Common street names include:

Arnolds, Juice, Pumpers, Roids, Stackers, and Weight Gainers

What do they look like?

Steroids are available in tablets and capsules, sublingual-tablets, liquid drops, gels, creams, transdermal patches, subdermal implant pellets, and water-based and oil-based injectable solutions.

The appearance of these products varies depending on the type and manufacturer.

How are they abused?

Steroids are ingested orally, injected intramuscularly, or applied to the skin. The doses abused are often 10 to 100 times higher than the approved therapeutic and medical treatment dosages. Users typically take two or more anabolic steroids at the same time in a cyclic manner, believing that this will improve their effectiveness and minimize the adverse effects.

What is their effect on the mind?

Case studies and scientific research indicate that high doses of anabolic steroids may cause mood and behavioral effects.

In some individuals, steroid use can cause swings, increased feelings of hostility, impaired judgment, and increased levels of aggression (often referred to as "roid rage")

When users stop taking steroids, they may experience depression that may be severe enough to lead one to commit suicide. Anabolic steroid use may also cause psychological dependence and addiction.

What is their effect on the body?

A wide range of adverse effects is associated with the use or abuse of anabolic steroids. These effects depend on several factors including age, sex, the anabolic steroid used, amount used, and duration of use.

(continued)

Anabolic steroids affect everyone The following may be experienced: water retention - leading to facial bloating acne - leading to permanent scarring irritability and mood swings more frequent colds aggression and violence increased sex drive sleeping 3, 12, 13 Long-term effects
