CONTROLLED LABS Green Magnitude, Synergistic Creatine Formula, Promotes .

Formula notes: Creatine Complex: Green Magnitude makes use of the same creatine blend as Green Bulge but this time with twice the dosage. Looks good! Powdered: No fancy capsules here. Simple design: It's one of those "lift a lot and leave" type of supplements. One scoop of magnitude 9. 5 lifts, please!

SCIENTIFIC REPORTS

OPEN Efficient feeder cells preparation system for large-scale preparation and application of induced pluripotent stem cells

Received: 12 July 2016
Accepted: 9 August 2017
Published online: 25 September 2017

Pengdong Li¹, Shichao Wang², Lixiang Zhan¹, Xia He¹, Guangfan Chi², Shuang Lv¹, Ziran Xu¹, Yuhan Xia¹, Shuzhi Teng¹, Lisha Li¹ & Yulin Li¹

Despite recent progress in the preparation of feeder cells for human induced pluripotent stem cells (hiPSCs), there remain issues which limit the acquisition of feeder cells in large scale. Approaches for obtaining feeder cells quickly on a large scale are in immediate need. To reach this goal, we established suspension-adhesion method (SAM) and three-dimensional (3D) suspension method (3DSM). In SAM, mouse embryonic fibroblast (MEF) growth were fully inhibited by 10 μ g/ml mitomycin-C (MMC) in 0.5 hours, and the feeder cells generated display higher adherent and recovery rates as well as longer survival time compared to conventional method (CM). 3DSM, an optimized method of SAM in which MEFs were cultured and MMC treated in suspension, was developed to lower the costs and workload using CELLSPIN System. The yield of feeder cells is several times the yield of SAM while the adherent and recovery rates and the capacity of supporting hiPSCs growth were not sacrificed. Hence, 3DSM is an economical and easy way to generate large-scale feeder cells for hiPSCs cultures.

Induced pluripotent stem cells (iPSCs) can be obtained from somatic cells by forced expression of a defined set of reprogramming factors, including either the combinations of Oct4, Klf4, Sox2, and c-Myc, or of Oct4, Sox2, Nanog, and Lin28¹⁻⁴. We previously reported to obtain iPSCs from human hair follicles-mesenchymal stem cells (hHF-MSC-derived iPSCs) using four Yamanaka factors (Oct4, Sox2, c-Myc and Klf4)⁵. These iPSCs are capable of self-renewal and differentiate into various cell types, feeder cells are required to support their growth while maintaining pluripotency.

Feeder cells are known to produce growth factors, adhesion molecules, and extracellular matrix. The most widely used feeder cells include mouse embryonic fibroblasts (MEFs). Recently, a xeno-free cell culture method was established to avoid contamination by pathogens and animal proteins^{6,7}. In that system, mouse feeder cells are replaced with human cells such as human fetal and adult fibroblasts⁸, human fetal muscle fibroblasts⁹, foreskin fibroblasts¹⁰, amniotic mesenchymal cells¹¹, adipose-derived mesenchymal stem cells¹², bone marrow mesenchymal stem cells¹³⁻¹⁵, placenta-derived mesenchymal stem cells¹⁶, multipotent mesenchymal stem cells of desquamated endometrium¹⁷, and decidua-derived mesenchymal cells¹⁸.

In spite of recent progress in hiPSCs culture conditions, large-scale production of hiPSCs by robust and economical methods has been one of the major challenges for the translational realization of hiPSCs technology¹⁹. To achieve large-scale production of hiPSCs, a large-scale culture system for hiPSCs expansion using the ER chemically defined and xeno-free medium has recently been developed²⁰. However, the efficiency of human feeder layers in the maintenance of undifferentiated human embryonic stem cells (hESCs) growth is not as high as that of mouse feeder cells due to the lower level of secretion of activin A²¹. Although there are numerous chemically defined and xeno-free media such as mTeSR and StemPro conducive to the production of hiPSCs, the inclusion of human serum albumin and human sourced matrix proteins makes those conditions prohibitively expensive, impractical for routine use, and not truly completely defined, which limits their use in large-scale amplification of hiPSCs^{22,23}. Thus, the feeder-based system remains an important method of hiPSCs propagation.

Controlled Labs Green MAGnitude Review - Supplement Critique

Controlled Labs Green MAGnitude is a revolutionary creatine blend containing the patented magnesium creatine chelate. Each serving of Controlled Labs Green MAGnitude contains 5 grams of dicreatine malate and magnesium creatine malate.

Controlled Labs Green MAGnitude - Muscle & Strength

I was an avid Controlled Labs fan back in my fitness days, using a number of products regularly. Those days have been over a few years now as life has gotten busier and busier, but I continue to take their Orange Triad + Greens supplement to this day and if Controlled Labs ever stopped producing it I'd be in trouble. I can't find anything else like it on the market, especially not at this .
