HGH Fragment 176-191 is a small piece (about 20%) of HGH. It has the fat burning benefits of HGH but not the other benefits associated with the full HGH structure. It also doesn't effect metabolism, Igf-1, insulin sensitivity, bone growth, etc. Fragment 176-191 is a Human Growth Hormone Peptide. This peptide is a truncated version of HGH which has become very popular within the past 5 years. It is a modified form of amino acids 176-191 of the GH polypeptide. Also, the peptide is an analog of the growth hormone-releasing factor (GRF) which signals the effects of GH.

The HGH Fragment is a modified form of amino acids 176-191 at the C-terminal region of the human growth hormone (HGH). Studies have shown that it works by mimicking the way natural HGH regulates fat metabolism but without the adverse effects on insulin sensitivity (blood sugar) or cell proliferation (muscle growth) that is seen with unmodified HGH.
