Pierwsze zarejestrowane medyczne zastosowanie miedzi znajduje się w Smith Papyrus, czyli jednej z najstarszych znanych ksiąg. Papyrus jest egipskim tekstem medycznym, napisanym między 2600 a 2200 roku pne, który zapisuje użycie miedzi do sterylizacji ran klatki piersiowej i sterylizacji wody pitnej. Inne wczesne doniesienia o medycznych zastosowaniach miedzi znajdują się w Papierze Ebersa, napisanym około 1500 roku pne. Dokument Ebersa Papyруса przedstawia medycynę praktykowaną w starożytnym Egipcie i innych kulturach, które kwitły wiele stuleci wcześniej. Związki miedzi polecano na bóle głowy, "drzenie kończyn" (być może odnoszące się do epilepsji lub tanca świętego Wita), palenie ran, swędzenie i pewne wzrosty w szyi, z których niektóre prawdopodobnie były wrzodami. Formy miedzi stosowane w leczeniu chorób wahały się od metalicznych odłamków miedzi i wiorów do różnych naturalnie występujących soli i tlenków miedzi.
