## Dmz 2.0 Vs 3.0: Is There Any Difference? - RAD Remedy

And Super DMZ 3.0 is 3 potent steroid stack. Both DMZ 2.0 and 3.0 contains Methylstenbolone and Dymethazine. However, DMZ 3.0 contains Alpha 1 that DMZ 2.0 doesn't. So, DMZ 3.0 promotes faster muscle gain than 2.0. Except that, there is no significant difference. That's just a glimpse. You can't decide anything yet with only this information.

### Abstract

“Nutritional supplements” that promise an increase in muscle mass and strength are becoming a go to item as enhancing one’s physical appearance becomes a more important part of our society. This is alarming because many of these nutritional supplements rely on androgen precursors to deliver their promises, without adequately informing consumers of the potential side effects of such agents. These products may conceal the presence of potent androgens to avoid regulatory sanctions and become more appealing to consumers. Recent reports have shown that some products marketed as “nutritional supplements” have been found to contain androgenic anabolic steroids. Methylstenbolone and dymethazine are new androgenic anabolic steroids currently gaining popularity among body builders for their performance-enhancing properties and rapid effects on muscle mass. These agents are found together in Super DMZ Rx 2.0, a “dietary supplement” for bodybuilders. Here we report the first case of Super DMZ Rx 2.0-induced cholestatic jaundice in a 26-year-old previously healthy Caucasian male, who took the supplement according to the manufacturer’s instructions for 30 days.

### Introduction

A significant percentage of athletes and teenagers use androgenic anabolic steroids (AAS) in their everyday lives. In a study of 718 athletes from 92 Amsterdam fitness centers, 8.2% of the athletes reported using performance-enhancing drugs.<sup>1</sup> A study of American teenagers found similar results, with 6.6% of 3403 12th-grade students admitting to consumption of AAS.<sup>2,3</sup> In addition, many over-the-counter dietary supplements that do not list AAS as ingredients may contain AAS, putting consumers at risk for potential adverse effects.<sup>4</sup> An international study conducted between 2000 and 2001 on 634 nutritional supplements purchased in 13 different countries revealed that 15% of putative nutritional supplements contain AAS.<sup>5</sup>

2,17 $\alpha$ -Dimethyl-5 $\alpha$ -androsta-1-en-17 $\beta$ -ol-3-one (methylstenbolone) is an AAS used by many “bodybuilding supplement” manufacturers. It has been compared to Superdrol (methyldrostanolone), a competitor that was recently banned by the Food and Drug Administration. Methylstenbolone is currently not a controlled substance in the United States. It is very potent and is prized among its users for giving them a

hard, dense, and dry muscular appearance.<sup>6</sup> 17 $\beta$ -Hydroxy 2 $\alpha$ ,17 $\beta$ -dimethyl 5 $\alpha$ -androstan 3-one azine (dymethazine), also currently not a controlled substance in the United States, is used in body building supplements by manufacturers such as iForce Nutrition. Dymethazine is a conjugate of 2 methyl-drostanolone residues and is very popular for its alleged myotropic effects.<sup>8</sup> Drostanolone, stenbolone, and “all related compounds” are banned substances on the World Anti-Doping Agency list and thus are banned for sports competition.<sup>9</sup>

Super DMZ Rx 2.0 (Blackstone Labs), the “Hardening Stack,” combines 10 mg of methylstenbolone and 10 mg of dymethazine into a capsule to be taken orally.<sup>8</sup> Consumers of this “dietary supplement” are advised by the manufacturer to take 1 to 2 capsules daily, preferably with food, with 2

Super DMZ 2.0 Review Now, time to share my personal experience with Super DMZ RX 2.0. It was last fall and decided on a six week cycle. I took two capsules the whole way out and it required about 1.5 bottles of DMZ 2.0. As winter was coming up, I decided upon making this a bulking cycle. I eat about 500 calories above my maintenance every day .
