Methenolone is an anabolic steroid, modification of dihydrotestosterone (DHT) with weak androgenic activity and a moderate anabolic effect. A notable trait of methenolone is that it can firmly bind to androgen receptors, stronger than testosterone. Adult doses for the treatment of aplastic anemia are usually in a range of 1-3 mg/kg per day. (Methenolone Enanthate) Methenolone is an anabolic androgenic steroid that was first released in 1962 by Squibb under the trade name Nibal (oral) and Nibal Depot (injectable). This was a very short-lived product on the U.S. market and by the mid-1960's the German pharmaceutical powerhouse Schering would own all rights to the Methenolone hormone.

Methenolone itself is a long acting anabolic, with extremely low androgenic properties. On the same note the anabolic effect is also quite mild, its potency considered to be slightly less than DecaDurabolin<sup>®</sup> (nandrolone decanoate) on a milligram for milligram basis. [the full report](#)
