## What is Oxymetholone? - GoodRx

Oxymetholone is used as a stimulator of bone marrow cells in the treatment of anemia and during the replacement of male sex steroid. It is used in improving general weakness in some diseases.

Oxymetholone might be abused by athletes in attempts to advance physical performance and thus it is classified at 'controlled substance schedule III.' The usual effective dose is 1-2 mg/kg/day but higher doses may be required, and the dose should be individualized. Response is not often immediate, and a minimum trial of three to six months should be given. Following remission, some patients may be maintained without the drug; others may be maintained on an established lower daily dosage.
