## Understanding Post-Injection Inflammation

After any injection, swelling and irritation (inflammation) can occur at the site where the needle entered the skin. This is a reaction to the needle or to the medicine that was injected. Or it may be a reaction to both. The reaction may happen right away. Or it may start hours after the injection. In most cases, the reaction isn't serious and goes away on its own.

### What causes post-injection inflammation?

The most common cause is the skin or the immune system's response to the needle or the medicine. Less common causes include an allergic reaction to the medicine. In rare cases, an infection at the injection site can occur.

### Symptoms of post-injection inflammation

Symptoms at the injection site may include:

- Sore when touched
- Swelling
- Itching
- Pain
- Redness
- Warmth
- Rash

### Treatment for post-injection inflammation

Treatment depends on the cause and how bad the reaction is. Most post-injection inflammation is mild. It goes away on its own in a few hours or days. If treatment is needed, it may include:

- **Cold packs.** These help reduce swelling, itching, and pain.
- **Over-the-counter pain medicines.** These help reduce pain and inflammation.
- **Prescription medicine.** These treat infection.

### Possible complications of post-injection inflammation

Be alert for a reaction all over your body. This may cause symptoms such as a skin rash, severe itching, or raised red bumps called hives. This kind of reaction can be serious, especially if it affects breathing. If you or your child develops symptoms away from the injection site, call your healthcare provider right away for more instructions.

Share on Pinterest Steroid injections may help severe symptoms. Synovial cysts are small, fluid-filled lumps that can form around joints. They usually develop on the facet joints of the lumbar .

## What Can Cause Pain After a Steroid Shot - Verywell Health

Many people can tolerate steroid injections with few side effects. The most common side effect of the treatment is temporary pain and swelling around the injection site. Some people may also experience some mild bruising or dimples around the area. Patients with chronic conditions such as diabetes or high

blood pressure may not be the best .

## Complications of Joint, Tendon, and Muscle Injections

FIGURE 3

### Basal joint or thumb carpometacarpal joint injection\*

1. Clean the area with alcohol, chlorhexidine, or iodine.
2. Use ethyl chloride spray prior to injection to provide temporary injection site pain relief.
3. Palpate the metacarpal base.
4. Perform a Grind test (see page 495) to help confirm the location of the CMC joint. Traction to the joint can be helpful to increase the joint space.
5. Inject the thumb CMC joint with a mixture of lidocaine/steroid (TABLE 1<sup>2-4</sup>). The patient typically reports immediate improvement in the pain that prompted the visit.

*\*The clinician performing the injection should wear sterile gloves; this photo was taken without gloves to better demonstrate hand position.*

Lipohypertrophy is a lump of thickened tissue that can develop in the subcutaneous fat layer. It can be common in people who regularly receive subcutaneous injections for certain health.

## What To Expect After Lumbar Epidural Steroid Injection

Lipohypertrophy is a lump of fatty tissue under your skin caused by repeated injections in the same place. It's common in people with diabetes. Lipohypertrophy can affect your body's ability to absorb insulin and cause serious complications. It's important to rotate injection or pump sites, inspect the skin and use a new needle for each injection.
