MK 677 is a new compound making waves in the anti-aging and fitness communities. Also known as Ibutamoren, MK 677 is gaining popularity as a protocol designed to enhance the body's production of Human Growth Hormone (HGH).. Many newbies confuse MK 677 as a Selective Androgen Receptor Modulator (SARM). The reality is that this compound is neither a SARM nor a peptide. Warm ups are just as important as cool downs! Make sure to decompress your muscles post workout team! Here are a few I did after my chest day workout.

I personally take 12.5mg of MK 677 a day year round now. Haven't seen any diminishing returns so it's a no brainer, and cheap too. If your bloodwork works good, I'd say do the MK 677 with the ostarine. For dosages, 10-15mg of MK 677 (lower doses provide the same effects with less bloating and water retention).
