The actions of anabolic steroids are therefore similar to those of male sex hormones with the possibility of causing serious disturbances of growth and sexual development if given to young children. Anabolic steroids suppress the gonadotropic functions of the pituitary and may exert a direct effect upon the testes.

Anabolic steroids are drugs that are chemically related to the main male hormone testosterone. They are best known for their effects on building muscle (called anabolic). Sometimes doctors prescribe anabolic steroids to help patients with HIV gain weight and to treat certain types of severe anemia (low red blood cells) or other health problems.
