Effects and side-effects

The activity of boldenone is mainly anabolic, with a low androgenic potency.

Boldenone will increase nitrogen retention, protein synthesis, increases appetite and stimulates the release of erythropoietin in the kidneys.

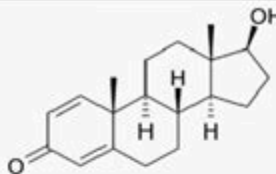

Boldenone was synthesized in an attempt to create a long-acting injectable methandrostenolone (Dianabol), for androgen deficiency disorders. Boldenone acts similar to methandrostenolone with less adverse androgenic effects. It has a very long half-life, and can show up on a steroid test for up to 5 months, due to the long undecylenate ester attached to the parent steroid. Trace amounts of the drug can easily be detected for months after discontinued use.

Although commonly compared to nandrolone, boldenone lacks progesterone receptor interaction and all the associated progestogenic side effects.

Boldenon 300 by Eurolab - Anabolic

Boldenone, also known as Δ 1-testosterone, 1-dehydrotestosterone, or androsta-1,4-dien-17 β -ol-3-one, is a naturally occurring androstane steroid and a derivative of testosterone. It is specifically testosterone with a double bond between the C1 and C2 positions. A related compound is quinbolone, the 17-cyclopentenyl enol ether of boldenone. . Sources. Boldenone occurs naturally in the scent .

BOLDENON 300 MG (BOLDENONA) 10 ML - EUROLAB - Mr. Suplementos

Boldenone je všestranný anabolický androgenní steroid, který lze použít pro víceúčelové použití. Není to účinný steroid pro získání obrovské svalové hmoty jako jiné anabolické steroidy, ale je to účinný anabolický steroid pro snížení tělesného tuku a získání vyšší síly. Boldenon tedy není směsí na objem, ale je to účinná sloučenina.
