The Future of Steroids for Performance Enhancement in the U.S. Military

LT Col Chad Peltier, MSC, USN; Kyle Pettijohn, PhD

Soldiers, especially those in the Special Forces, rely on elite levels of fitness to perform their jobs. Strength, endurance, and cognition, each of which contribute to greater fitness for duty, may be improved through the use of performance enhancing drugs (PEDs), thus PEDs could increase the likelihood of successfully completing a mission. Despite this potential improvement, PEDs are generally not legally available to Soldiers, which may be a missed opportunity. This is not to argue that Soldiers should be given PEDs, but that we should seek to more fully understand them and arrive at a scientifically informed decision on whether to use PEDs in specific circumstances.

PED is a general term that encapsulates any drug that a user can take to improve performance by some measure, whether that is mental or physical. For instance, Modafinil is used for cognitive enhancement, capable of maintaining wakefulness and increasing performance in several cognitive tasks,¹ while recombinant human erythropoietin can be used for cardiovascular improvement and can increase a runner's time to exhaustion by 54%.² Though there are many potential PEDs that are worthy of further discussion, the primary focus here is steroids, with two studies specifically referencing the steroid testosterone. Because they increase muscle strength, they can be useful to improve job performance for many in the military, including SEALs, Marines, Paratroopers, and Rangers. While the discussion is centered on steroids, many of the points raised can be applied to other PEDs that are considered controlled substances that have not been thoroughly investigated.

Current and future use of steroids in the military is an issue that needs to be addressed. Researchers at a 2016 Consortium of Health and Military Performance (CHAMP) symposium

outlined five primary concerns that the military should pursue.³

These included encouraging further exploration of steroid use, understanding the true prevalence of steroids, understanding the costs and benefits of steroids, connecting users to trusted sources of information, and collaborating with other organizations to address these concerns. The motivation for these recommendations partially comes from an anonymous survey of U.S. Army Rangers that revealed that ~1/4 used an illegal steroid or other PED.⁴ This is a serious issue when considering the health of these Soldiers. Because of the illegality of steroids in the U.S. military, most users do not have professional medical oversight. Further, 92% of users believe that medical professionals lack knowledge about the science of steroid use⁵ – and they are not wrong. The scientific literature regarding steroids use is severely lacking. Methodological limitations and legality issues limit the ability of researchers to thoroughly investigate steroids. Here we will outline some of the existing literature on steroid use, including potential positive and negative outcomes. We acknowledge that some conclusions are weakly supported, or only backed by survey data, but this only reinforces the overall conclusion: the existing literature on steroids is limited and additional research is necessary to establish their role in the future of the military.

Research into the costs and benefits of steroids is limited. Both lab-based studies and surveys of real-world users have distinct advantages and disadvantages. In lab-based studies, researchers have more control: males are given a measured dose of a single steroid over a specified time period, calorie intake is monitored, drug purity is known, and expectations are often managed by placebo-controlled designs. The advantage of lab-based studies is that they are able to answer specific questions accurately. One study was performed using active duty U.S. Soldiers who received weekly injections of either 100 ($n = 8$) or 300 ($n = 7$) mg of testosterone.⁶ The 300 mg group increased average lean body mass by 7.5 lbs, while there was no significant change for the 100 mg group. Physical performance changes were tracked with isokinetic knee and elbow extension/flexion and showed significant increases in strength for the 300 mg group. While this study demonstrates that a higher dose of

SUBJECT: Interaction with the Media

It is important that the news media have appropriate access to many aspects of DoD activities and operations. Consistent with applicable laws and procedures, we are obliged to ensure that the information provided to them is timely, accurate, credible, and consistent. I have said many times that we must strive to be as open, accessible, and transparent as possible.

At the same time, I am concerned that the Department has grown lax in how we engage with the media, often in contravention of established rules and procedures. We have far too many people talking to the media outside of channels, sometimes providing information which is simply incorrect, out of proper context, unauthorized, or uninformed by the perspective of those who are most knowledgeable about and accountable for inter- and intra-agency policy processes, operations, and activities.

We must deal with the media in a manner that safeguards information protected by law and that maintains the integrity of the government's internal decision making processes. Leaking of classified information is against the law, cannot be tolerated, and will, when proven, lead to the prosecution of those found to be engaged in such activity. Revealing unclassified, but sensitive, pre-decisional, or otherwise restricted information is also prohibited unless specifically authorized.

Current DoD policy, outlined by Directive 5122.05, "Assistant Secretary of Defense for Public Affairs," (attached) states that the Office of the Assistant Secretary of Defense for Public Affairs is the sole release authority for official DoD information to news media in Washington, and that all media activities must be coordinated through appropriate public affairs channels. This policy is, all too often, ignored. Accordingly,

Drug offenses in the military are addressed under Article 112a of the UCMJ. According to the article itself, "Any person subject to this chapter who wrongfully uses, possesses, manufactures, distributes, imports into the customs territory of the United States, exports from the United States, or introduces into an installation, vessel, vehicle, or aircraft used by or under the control of the .

Which supplements are banned by the military? Better check this database

January 26, 2019 Over the last 10 years, the firm has seen an increasing number of cases involving performance-enhancing drugs, steroids, and banned pro-hormones.
