

Vincent Williams When it comes to health and wellness, particularly in the realm of drug research and development, few things are as fascinating as the ever-evolving science behind Peroxisome proliferator-activated receptors (PPARs). In particular, the emerging potential of a substance known as GW0742 is turning heads in the scientific community.

PPAR δ agonist GW0742 interacts weakly with multiple nuclear receptors .

Administration of GW0742 (0.3 mg/kg, i. p. bolus) 30 min before and 30 min after a challenge with CAR caused a reduction in all the parameters of inflammation measured. Thus, based on these findings, we propose that a PPAR- β/δ agonist such as GW0742 may be useful in the treatment of various inflammatory diseases.

The peroxisome proliferator-activated receptor β/δ agonist GW0742 has .

" Rat" #1 Common base pace: 8:30 Weight: 153 lbs Dry lean Muscle Mass: 39 lbs Body Fat Mass 7. 1 lbs Body composition measured by InBody Scale (98% accurate) Height: 5'10" Average Resting Heart Rate: 45 BPM (last 4 weeks) Average Sleep Quality: 73% (last 4 weeks) Current Training Status: Recovery Approx. Figure 6 Changes in PEPCK expression induced by GW0742 in the liver of type I-like diabetic rats.

Notes: Changes of PEPCK expression in STZ-induced diabetic rats are shown as STZ for comparison with the changes in normal rats, Normal. Additionally, the effects of GW0742 on diabetic rats are shown as STZ + GW0742 at the indicated dose compared to diabetic rats that received vehicle only (STZ + vehicle). Representative immunoblots are shown in the upper portion, and the relative expression levels of PEPCK are shown in the lower column (mean \pm SE) obtained from groups of six samples each. * $P < 0.05$ compared with STZ + vehicle.

Abbreviations: GLUT, glucose transporter; GW, GW0742; GW0742, selective PPAR- δ agonist; PEPCK, phosphoenolpyruvate carboxykinase; PPAR, peroxisome proliferator-activated receptor; SE, standard error; STZ, streptozotocin.

GW0742 (also known as "Lipoline" in underground bodybuilding circles) is a peroxisome proliferator-activated receptor beta/delta (PPAR β/δ) agonist that is manufactured by pharmaceutical company GlaxoSmithKline (GSK).

Activation of PPAR- β/δ Attenuates Brain Injury by Suppressing Inflammation and Apoptosis in a Collagenase-Induced Intracerebral Hemorrhage Mouse Model

Abstract

Brain injury has been proposed as the major cause of the poor outcomes associated with intracerebral hemorrhage (ICH). Emerging evidence indicates that the nuclear receptor, peroxisome proliferator-activated receptor β/δ (PPAR- β/δ), plays a crucial role in the pathological process of central nervous impairment. The present study was undertaken to evaluate the protective effects of PPAR- β/δ activation using a selective PPAR- β/δ agonist, GW0742, against brain injury after ICH in a mouse model. ICH was induced by intravenous injection of collagenase into the right caudate putamen. To examine the protective effect of PPAR- β/δ activation against ICH-induced brain injury, mice were either intraperitoneally injected with GW0742 (3 mg/kg, body weight) or saline (control group) 30 min before inducing ICH. Behavioral dysfunction was evaluated 24 and 72 h after injury. Then, all mice were killed to assess hematoma volume, brain water content, and blood–brain barrier (BBB) permeability. TUNEL and Nissl staining were performed to quantify the brain injury. The expression of PPAR- β/δ , interleukin (IL)-1 β , tumor necrosis factor (TNF)- α , Bcl-2-related X-protein (Bax), and B-cell lymphoma 2 (Bcl-2) in the perihematomal area was examined by immunohistochemistry and western blotting analysis. Mice treated with GW0742 showed significantly less severe behavioral deficits compared to the control group, accompanied by increased expression of PPAR- β/δ and Bcl-2, and increased expression of IL-1 β , TNF- α , and Bax decreased simultaneously in the GW0742-treated group. Furthermore, the GW0742-pretreated group showed significantly less brain edema and BBB leakage. Neuronal loss was attenuated, and the number of apoptotic neuronal cells in perihematomal tissues reduced, in the GW0742-pretreated group compared to the control group. However, the hematoma volume did not decrease significantly on day 3 after ICH. These results suggest that the activation of PPAR- β/δ exerts a neuroprotective effect on ICH-induced brain injury, possibly through anti-inflammatory and anti-apoptotic pathways.
